First step of understanding network infrastructure is to understand the structure of our nearest network, network runned and owned by our Internet service provider. During our research we had a luck to explore and map one of the World's biggest bot-tom-up, citizen-driven, free, open and neutral telecommunications network- guifi-net. This unique network, based mostly in Catal-onia consist of more than 32.500 operating nodes. This map is the network graph of guifi-net, where each dot represent one router, server of a computer and each line represent a link, a wireless or a cable that connect them.
